

# Data Analyst – Technical Test Answers

Jafar Shodiq

1. What are your strategies to enable self-service analytics in the company?

## **A. Introduction**

- a. What is self-service business intelligence (SSBI)?

Self-service business intelligence is an approach that empowers business users to perform data analytics such as filter, sort, analyse, and visualize on their own without the needs for BI background or related fields.

- b. What are the benefits of SSBI?

- Business users will be able to do their own ad-hoc analysis, meaning that BI and IT teams can focus more on higher-value priorities that require more technical skills.
- Accelerates business processes and decision-making.
- Creates a fully data-driven culture in the organization.

## **B. Strategies**

- a. Overview

My strategies would involve using specific application/software for the data input process so that the values are all in the uniform format. The data values will then be stored in a database server. Lastly, Tableau will be able to read the server database as a data source which will then able to continuously monitor the updates in the database.

- b. Technology/tools that could be used

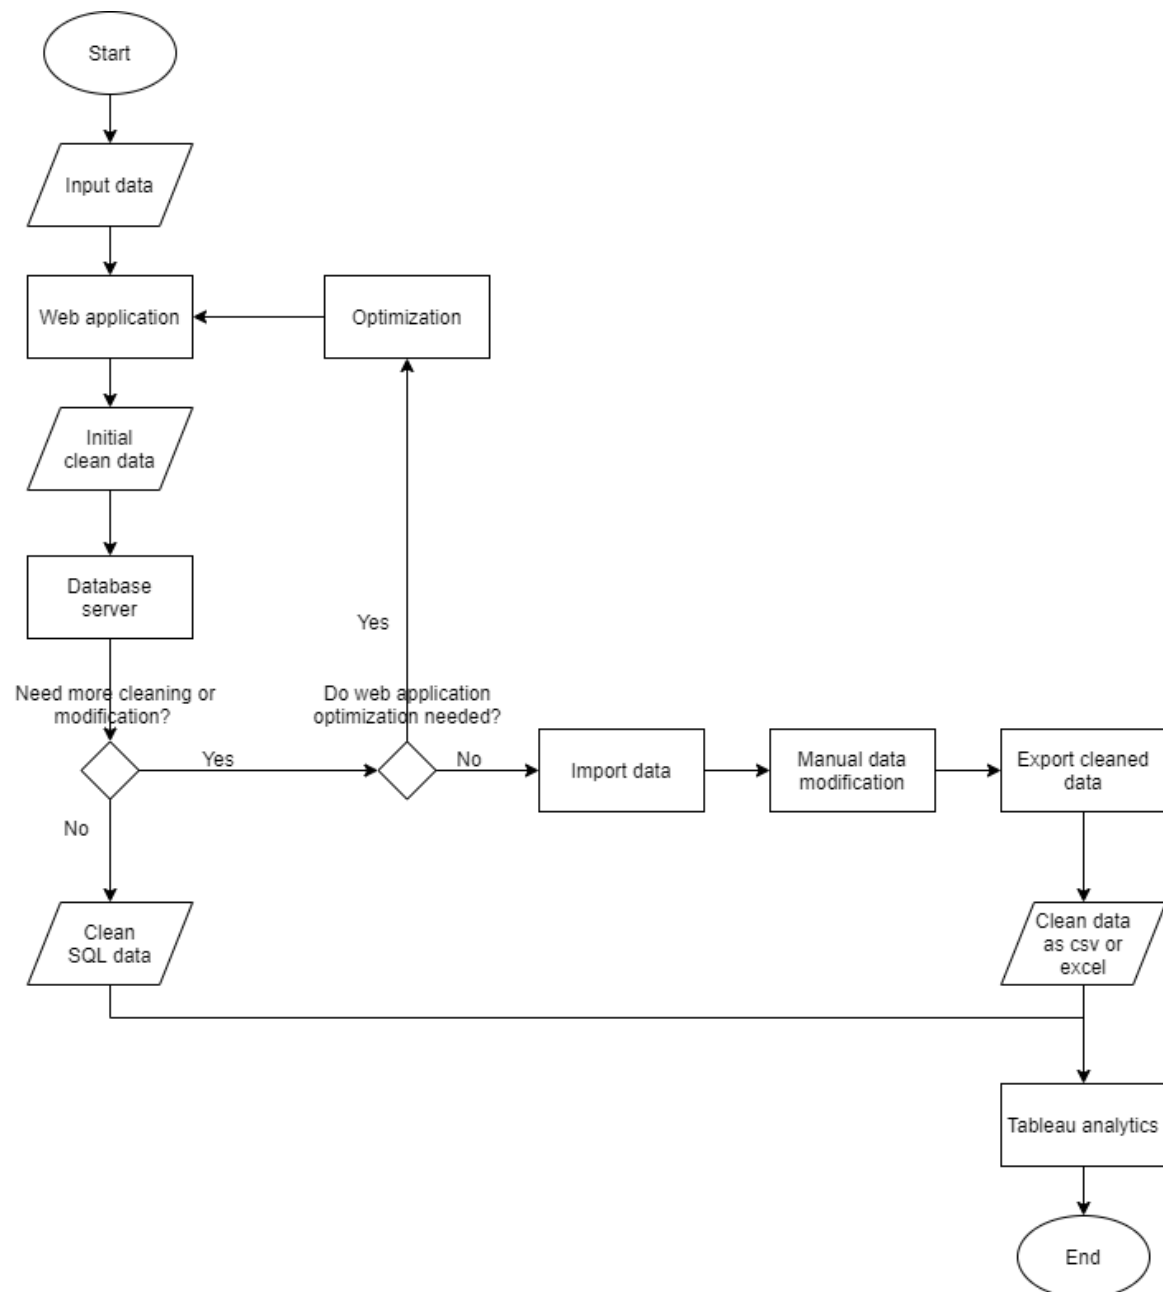

- Web application (with APIs)
- Python libraries
- Database server
- Tableau

- c. Why Tableau?

Tableau is known for taking any kind of data from almost any system, and turning it into actionable insights with speed and ease. Tableau makes exploring data more intuitively and easily with only dragging and dropping the components. Tableau also supports different

devices such as mobile phone or tablet for displaying dashboards. Moreover, Tableau community has more than one million of active, diverse, creative, and supportive members worldwide.

d. Flowchart

Description:

- *Input data*: useful information such as names, location, dates, etc
- *Web application*: from my own experience and knowledge, web application can be built with backend and frontend development. The former requires API, which can be

developed using Python Flask, and database management while the latter JavaScript. This web application includes component like textboxes, dropdowns, buttons, etc.

- *Initial clean data*: data sent to the database after hitting the 'submit' button.
- *Database server*: Server to store data, e.g., using MySQL.
- *Clean SQL data*: data if the initial clean data does not need further cleaning or modification.
- *Optimization*: Optimize or modify the web application if further cleaning or modification needed and crucial for base data input.

For example, there is a column addition in database server. An additional input component will be needed in the web application.

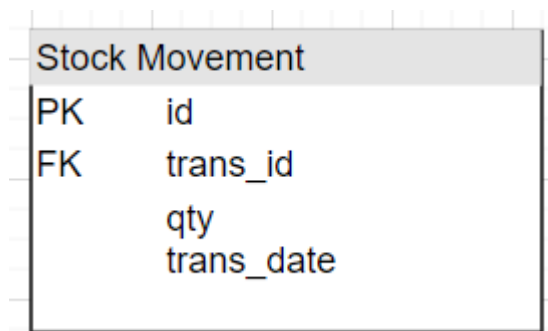

- *Import data*: data from server will be imported if there is no need to optimize or modify the web application.
- *Manual data modification*: Data cleaning using tools like Pandas or NumPy.
- *Export cleaned data*: Export the data that had been cleaned or modified to csv or excel file.
- *Clean data as csv or excel*: data after manual cleaning and modification.
- *Tableau analytics*: Data either from SQL or as csv or excel file will then be analysed and visualized using tools in Tableau.

e. What will be our role as data analysts?

If self-service business intelligence is going to be implemented, as a data analyst, while we can help business users analyzing and visualizing using Tableau, we can also do database maintenance and produce cleaned data when needed.

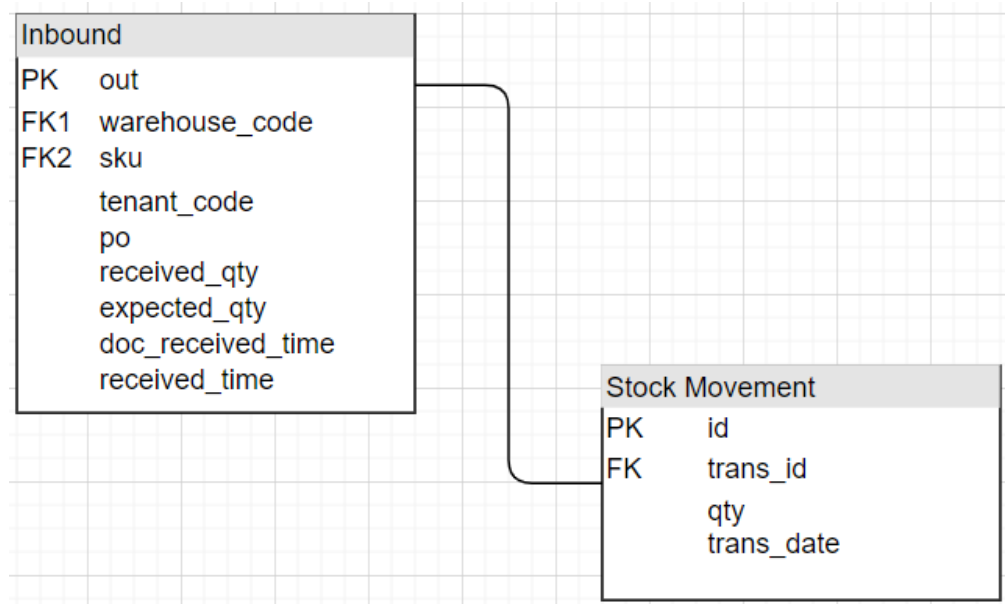

2. Please create a data warehouse schema and explain your steps.

a) Stock Movement

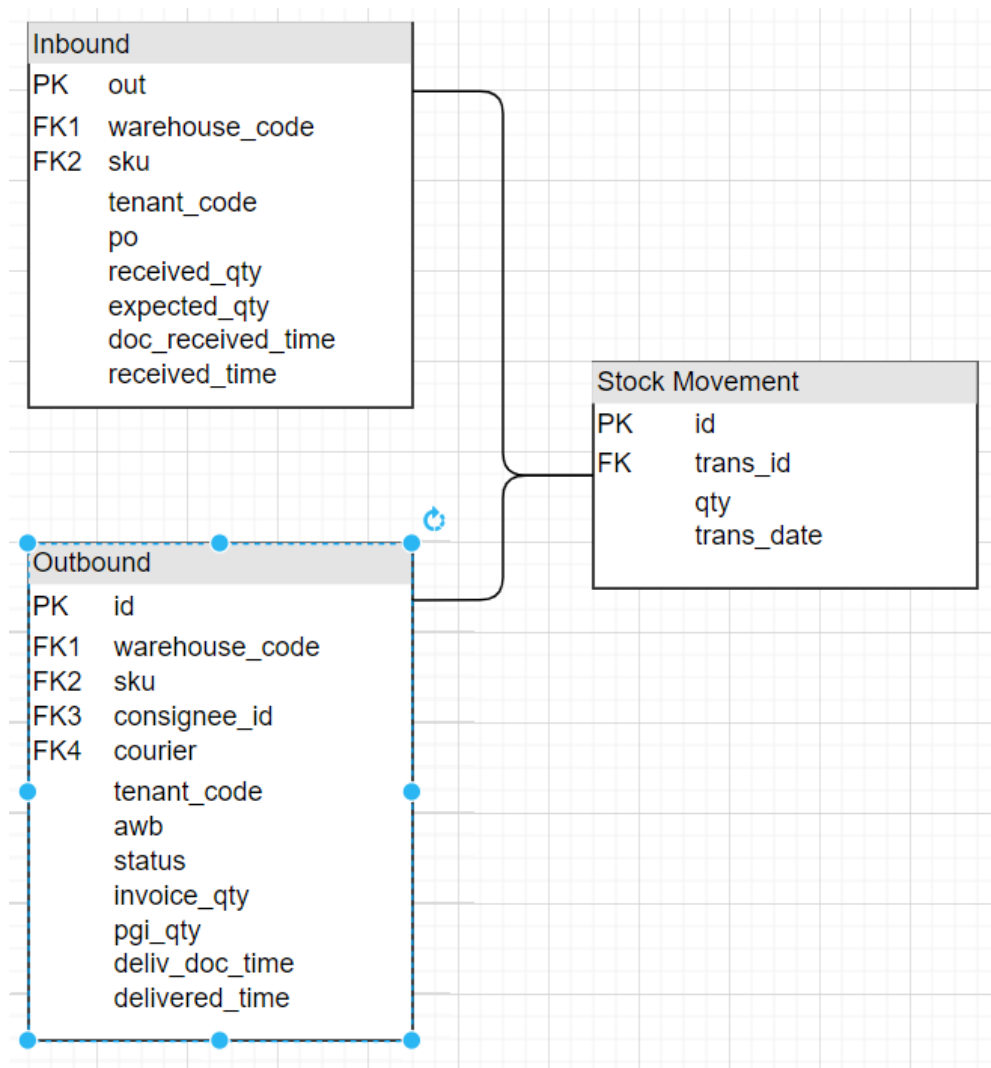

Stock Movement table has attributes: `id`, `trans_id`, `qty`, and `trans_date` with `id` as the primary key and `trans_id` as a foreign key.

b) Inbound

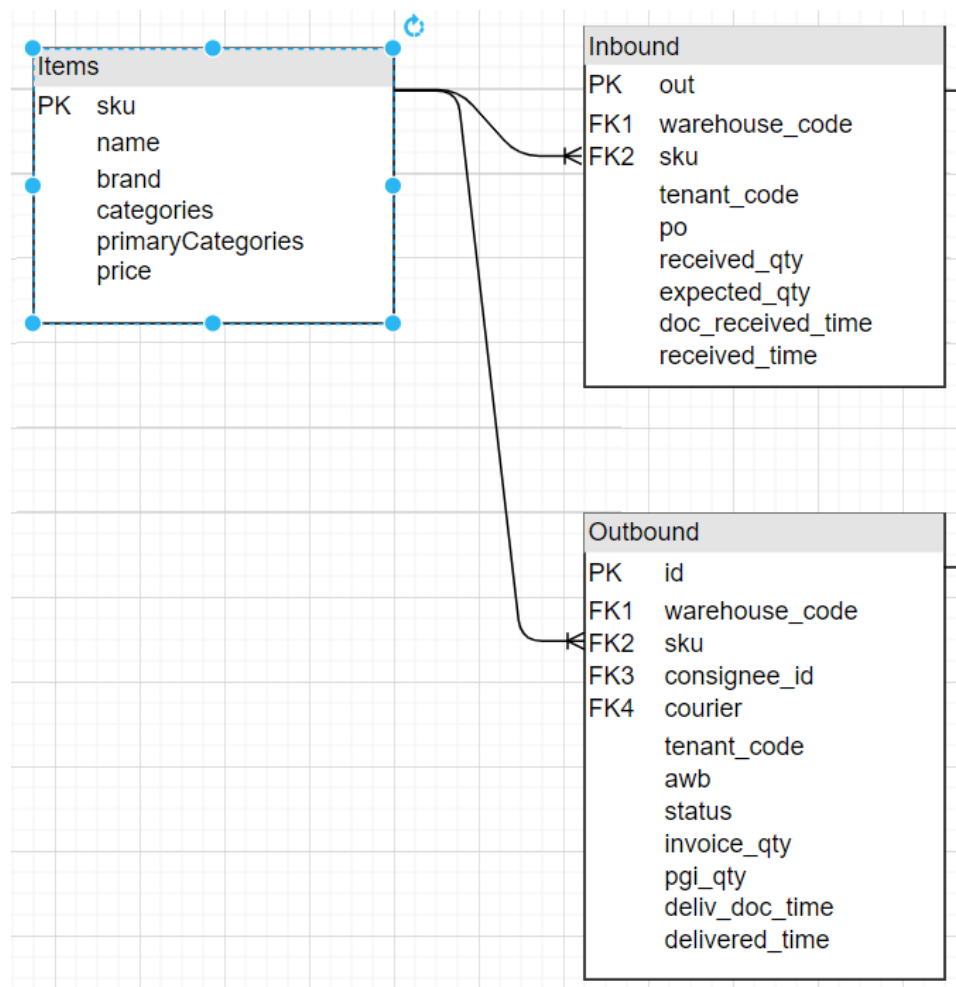

Inbound table has attributes: `out`, `warehouse_code`, `sku`, `tenant_code`, `po`, `received_qty`, `expected_qty`, `doc_received_time`, and `received_time` with `out` as the primary key and `warehouse_code` and `sku` as foreign keys. Attribute `out` from Inbound table has one-to-one relationship with attribute `trans_id` from Stock Movement table.

c) Outbound

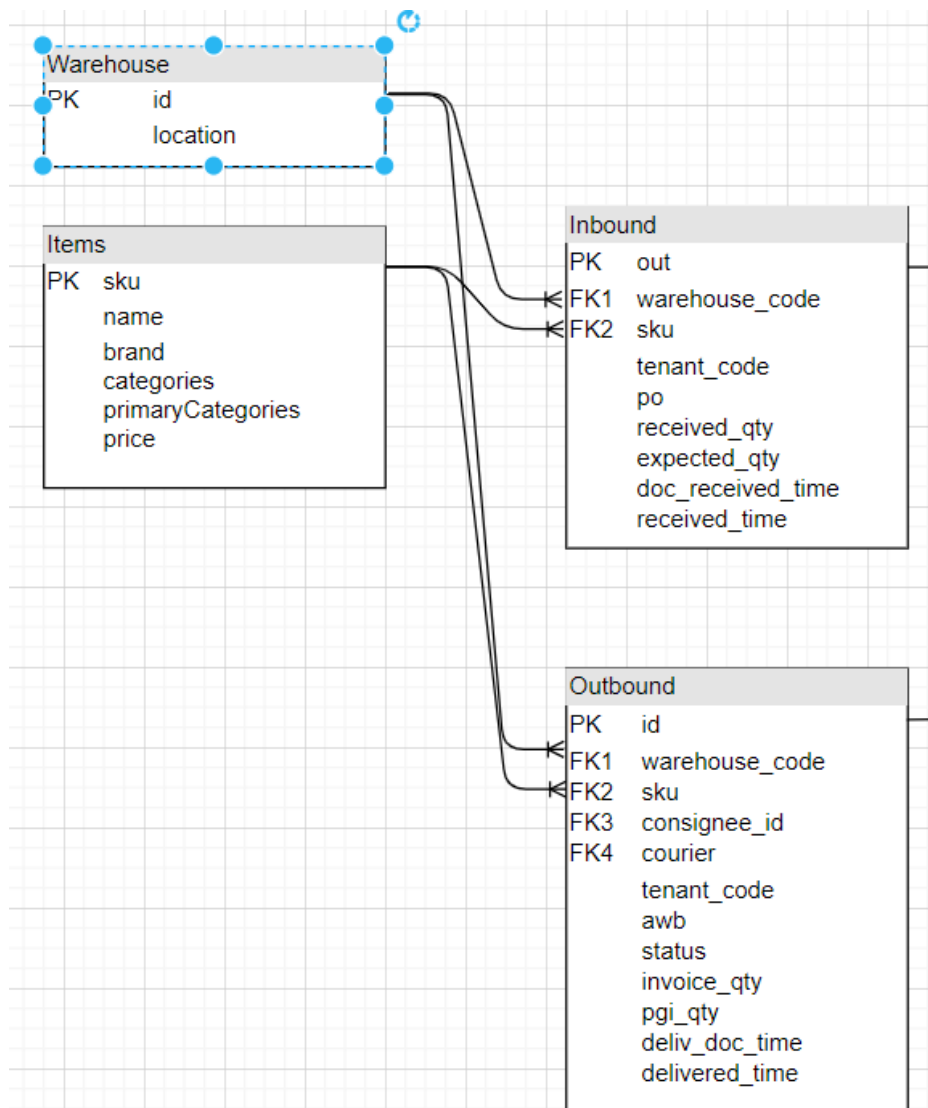

Outbound table has attributes: `id`, `warehouse_code`, `sku`, `consignee_id`, `courier`, `tenant_code`, `awb`, `status`, `invoice_qty`, `pgi_qty`, `deliv_doc_time`, and `delivered_time` with `id` as the primary key and `warehouse_code`, `sku`, `consignee_id`, and `courier` as foreign keys. Attribute `id` from Outbound table has one-to-one relationship with attribute `trans_id` from Stock Movement table.

d) Items

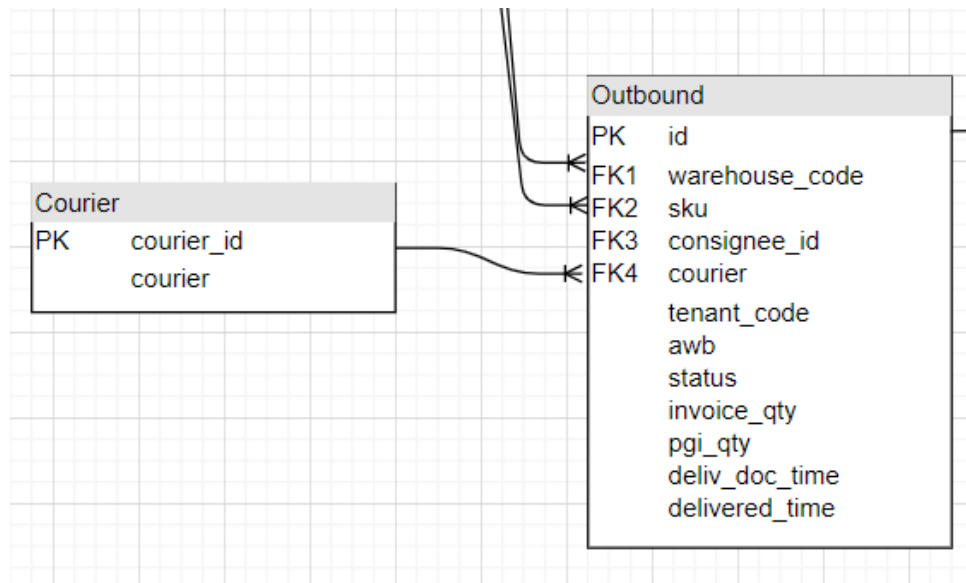

Items table has attributes: sku, name, brand, categories, primaryCategories, and price with sku as the primary key. Attribute sku has one-to-many relationship with attribute sku from both Inbound and Outbound table.

e) Warehouse

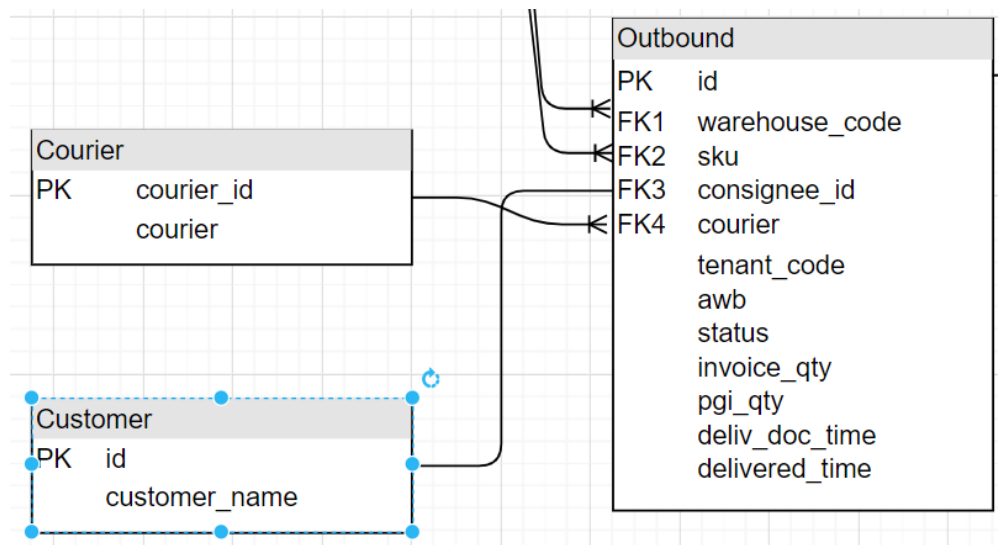

Warehouse table has attributes: id and location with id as the primary key. Attribute id has one-to-many relationship with attribute warehouse\_code from both Inbound and Outbound table.

f) Courier

Courier table has attributes: `courier_id` and `courier` with `courier_id` as the primary key. Attribute `courier_id` has one-to-many relationship with attribute `courier` from Outbound table.

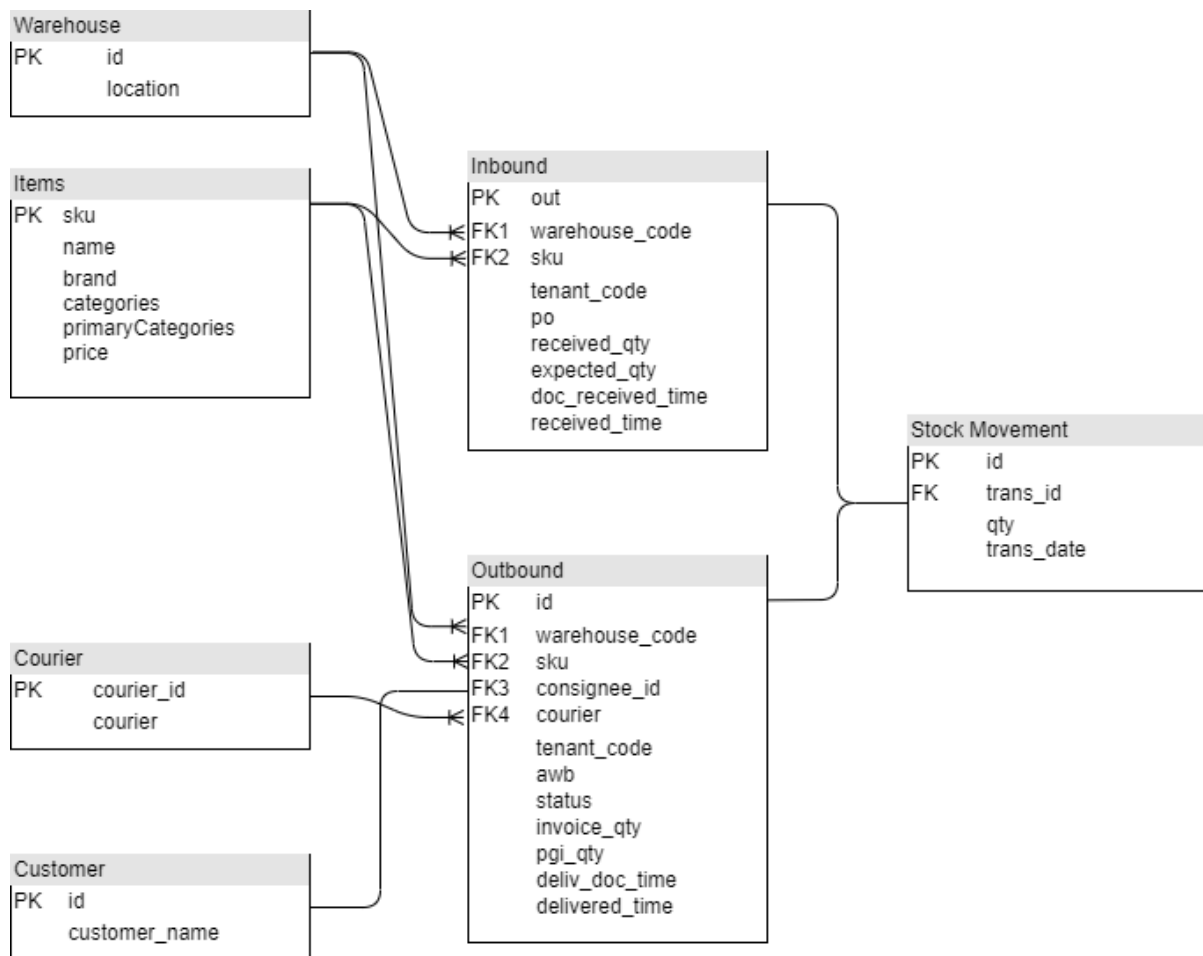

g) Customer

Customer table has attributes: `id` and `customer_name` with `id` as the primary key. Attribute `id` has one-to-one relationship with attribute `consignee_id` from Outbound table.

## Final diagram

3. Please create dashboard mock-ups for these use cases. (At minimum you can provide stock movement dashboard)

The dashboard can be found on this link:

<https://public.tableau.com/app/profile/jafar.shodiq/viz/MIG-assessment-dashboard/stock-movement-dashboard>

### Stock Movement Dashboard

Before I loaded the excel file into Tableau, I did some modification on the Stock Movement table so that it contains additional information such as transaction category, warehouse code, and tenant code. Transaction category (`trans_cat`) is based on the `trans_id` column, while `warehouse_code` and `tenant_code` are based on Inbound and Outbound tables.

	A	B	C	D	E	F	G	H
1	id	trans_id	qty	trans_date	trans_cat	warehouse_code	tenant_code	
2	1	INB003594	40	2020-10-22 14:20:00	Inbound	WH3	XYZ	
3	2	OUT00000	1	2020-10-24 11:46:00	Outbound	WH3	XYZ	
4	3	OUT00003	1	2020-10-26 14:04:00	Outbound	WH3	XYZ	
5	4	OUT00001	1	2020-10-28 14:20:00	Outbound	WH3	XYZ	
6	5	INB003602	7	2020-10-28 14:58:00	Inbound	WH3	XYZ	
7	6	INB003602	36	2020-10-29 11:49:00	Inbound	WH3	XYZ	
8	7	INB003606	92	2020-10-30 17:21:00	Inbound	WH3	XYZ	
9	8	OUT00003	1	2020-11-03 12:16:00	Outbound	WH3	XYZ	
10	9	OUT00007	1	2020-11-03 12:18:00	Outbound	WH3	XYZ	
11	10	INB003612	21	2020-11-03 15:21:00	Inbound	WH3	XYZ	
12	11	OUT00359	5	2020-11-03 17:12:00	Outbound	WH3	XYZ	
13	12	INB003612	6	2020-11-03 20:07:00	Inbound	WH3	XYZ	
14	13	OUT00004	1	2020-11-04 12:20:00	Outbound	WH3	XYZ	
15	14	OUT00004	1	2020-11-04 12:23:00	Outbound	WH3	XYZ	
16	15	OUT00004	1	2020-11-04 16:11:00	Outbound	WH3	XYZ	

Quantity by Transaction Date

This dashboard takes the sum of the `qty` column as the y-axis and the day from `trans_date` column as the x-axis .

#### Filters

##### Trans Cat

- ☒ Inbound
- ☒ Outbound

##### Year of Trans Date

- ☒ 2020
- ☒ 2021

##### Month of Trans Date

- ☒ January
- ☒ February
- ☒ March
- ☒ October
- ☒ November
- ☒ December

##### Warehouse Code

- ☒ WH1
- ☒ WH2
- ☒ WH3
- ☒ WH4

##### Tenant Code

- ☒ XYZ

It can do filters on the transaction categories (inbound or outbound), year, month, warehouse code, and tenant code.

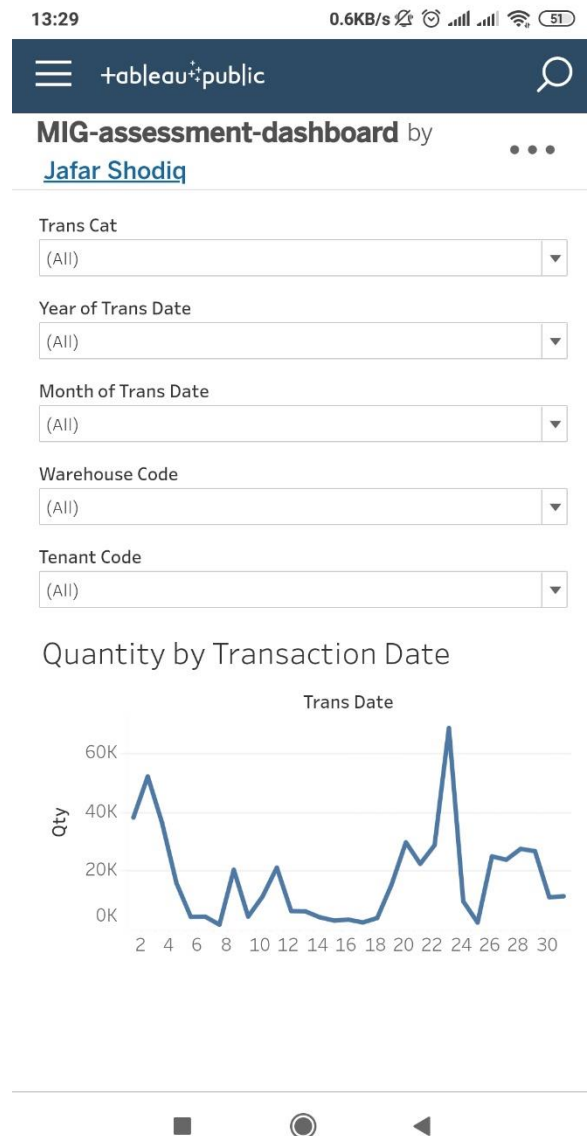

Tableau also supports dashboard view on different devices like mobile phone.

4. Give us top 3–8 interesting insights you could find from the datasets.

a. Overall quantity

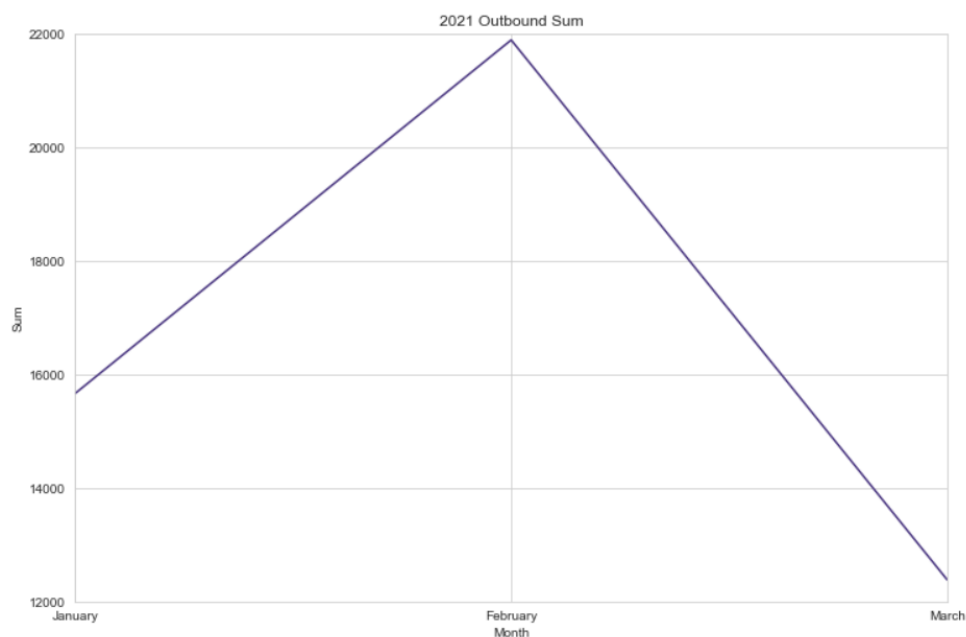

Overall quantity movement the most in 2020 is at the near end of the month.

Overall quantity movement the most in 2021 is at the start of the month.

b. Outbound in 2021 from January – March

	Month	Sum
0	January	15664
1	February	21888
2	March	12382

There's an increase of 39.73% from January to February and decrease of 43.43% from February to March.

c. Busiest warehouse

Activities (inbound and outbound) in each warehouse.

### Warehouses Inbound

WH3	1380
WH1	1356
WH2	1242
WH4	1233

### Warehouses Outbound

WH1	31167
WH3	22005
WH4	17533
WH2	16725

Looking at what month each warehouse has the most activities.

d. Categories in Items table

Table Items has 1546 rows. In `categories` column, values are stored on top of each other with multiple comma splits inside. In result, there are 782 unique values in column `categories`.

5. Top 5 metrics to define the success of this product, what, why and how would you choose?

a. Inventory Accuracy

Based on the dataset, which is about stock movement, inventory accuracy is extremely important because every inbound or outbound should be in order so that every action is effective and efficient.

b. Inventory Turnover

Measures how many times per year each warehouse goes through the entire stock. A warehouse management system should be able to not let items sit in the warehouse for a long time.

c. Order Picking Accuracy

Based on the Outbound table, each order has to be accurate so that clients will not go somewhere else.

d. Receiving Accuracy

Based on the Inbound table, the proportion of received orders have to be accurate against purchase orders.

e. Days Sales Outstanding

Based on the Outbound table, how quickly does the organization receive payment from customers.
